# 8 Days To Final Season

Daenerys Targaryen wants to siege the King's Landing with her two great army Dotrhaki and Unsullied. Two armies are in Winterfell in the beginning. Daenerys wants to send these armies using non-crossing two paths and she gives orders to Tyrion about finding these paths. There is a map with N rows and M columns and there are S cities on some points(N_i, M_j) which can not be passed without conquering them.
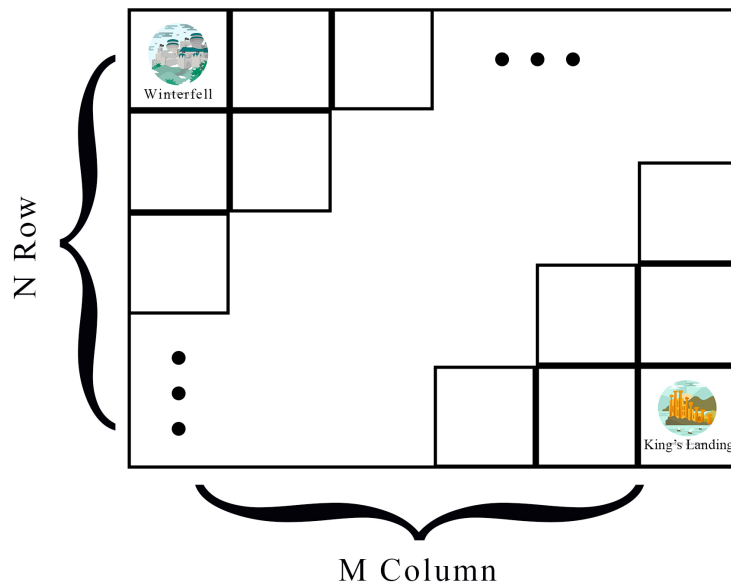

Daenerys have 3 rules about paths:
- Since Winterfell is at $(1,1)$ and target is at (N, M), armies can only move one point down or one point right each time because they must arrive to the target as soon as possible.
- If a city is conquered, armies must leave some soldiers to take care of the city and Daenerys doesn't want to lose too much soldiers on the road so there can be at most F cities conquered.
- Two armies' path must not intersect on any point until King's Landing.

Find out how many different ways there are to go to King's Landing from Winterfell with two armies and print the output modulo P.

Input Format:

There are 5 different input scenarios.
For every scenario; first line contains 5 different integers N,M,S,F,P; The number of rows and columns, total number of cities in map(excluding Winterfell and King's Landing), number of cities that can be conquered, modulo respectively.
Next S line contains coordinates of cities.

Constraints

$1 < N,M \leq 10^5$
$0 < F \mathrel{!}= S \leq 200$
$1 \leq P \leq 10^9$

Output Format

One line for each scenario, number of ways to go to King's Landing.

Sample Input 0

2 3 1 0 20
1 2
2 3 1 1 20
1 2
3 3 0 0 10
3 3 1 0 12
2 2
4 3 2 1 12
2 2
1 3

Sample Output 0

0
1
3
1
5

Explanation 0

In first scenario:

```
* x .
. . *
```

There are one city and F is zero, there are no non intersecting paths without conquering a city; second scenario has the same map and F is one, so armies can pass the city. there is one possible way with one army follows 2 points right and one point downwards. The other army goes one point down and 2 points rightwards.
